Self-Paced Module: Market Analysis and a System Proposal

Java Programming · Grade 12 TVL · Cielito Zamora Senior High School
Week 20 · November 30–December 4, 2026 · Continues Week 19
Name: _____ Section: _____ Date: _____

Day / time	Focus	Work and strip
Mon Nov 30 / 2 h	Problem, users, alternatives	Page 1 Activity 1; Monday strip, page 7 bottom.
Tue Dec 1 / 2 h	Own-theme SWOT	Page 2 Activity 2; Tuesday strip, page 7 middle.
Wed Dec 2 / 2 h	Four feasibility checks	Page 3 Activity 3; Wednesday strip, page 7 top.
Thu Dec 3 / 3 h	Proposal and own-theme start	Pages 4–6 Activity 4; Thursday strip, page 8 bottom.
Fri Dec 4 / 3 h	Check, revise and present	Page 6 Activity 5; Friday strip, page 8 top.

How to use: Work in order. Write Activities 1–5 in a notebook; use the planning space and starter. Keep notes for your proposal. LIPLET means quiz strip. All work is possible offline using this module, existing programs, observation or labelled scenarios. No survey, paid tool, internet or personal-data collection is required.
Where we left off: Keep both programs: **java Main** opens Vehicle; **java RequestDemo** opens school-materials practice. Retain the model, exceptions, FareService/FareCheck, ReadyTask, five Week 16 helpers, optional demonstrations and every .txt backup. The CodeShare starting files apply all four Week 19 steps, not just its older starterFiles. No code change or new launcher backup is required this week. Common-error guide: page 5.

MONDAY | Find a Useful Problem and Check the Need

Goals: Distinguish a problem, a user need, evidence, an assumption and a proposed feature. **Value:** Respect users and report only what the available evidence supports. **Produce:** Write a problem statement, alternatives comparison and evidence record for your own theme.

Definition | Market analysis. A careful look at intended users, their needs and existing alternatives. In this small school project, it helps you judge whether an improvement is useful; it does not require sales forecasts or an invented market size [YD] [IF].

ANALOGY Before adding another counter at a materials desk, find out what learners cannot finish at the current desk. A brighter sign may help more than a new computer.

Worked classroom scenario, not field research. Imagine a school-materials desk using loose paper requests. The scenario says some requests omit a subject or collection place. Intended users are learners preparing a request and a desk helper reading it. No interview, survey or count of actual school requests was conducted.

Statement	How to record it
Scenario fact: some paper requests omit a subject.	Given in this exercise; not evidence about our school.
Assumption A1: a complete summary would reduce clarification.	Unverified; compare completion and clarity in a later trial.
Proposed feature R1: show a complete request preview.	A design choice; not proof that users need or prefer it.

User need: prepare a clear request containing subject, materials and collection place. **Existing alternatives:** keep loose paper; use a labelled paper form; use the existing RequestDemo draft. Paper works without a powered computer. A labelled form may solve missing fields cheaply. RequestDemo can check choices, but does not submit requests, promise stock or save a record.

Activity 1 | Own-theme need record. In your notebook, name your existing theme program and one current capability. Write: "[User] needs to [task] because [specific difficulty]." Compare the present/manual process and one other available alternative. Record one item you actually observed, with its context, or label it an assumption and say what would verify it. Do not collect personal details. Finish with one limited improvement and why it may help.

Check yourself: "Everyone wants my app" is unsupported. Replace it with a named user group, task and labelled basis. Classmate role-play is classroom feedback, not field research. If evidence is absent, an honest assumption record is acceptable.

Activity 1 planning record

Record in your notebook or here	Your own theme
Existing capability / intended user	_____
Task / difficulty / alternative	_____
Basis or assumption / how to verify	_____

Course history: Week 11 classes/objects; 12 four OOP pillars; 13 exceptions; 14 collections; 15 file handling; 16 threads; 17 Swing basics; 18 layout managers/panels; 19 advanced components/user interaction.
Code verification: The retained final sources compile with Java 8 compatibility; FareCheck was run. Both launchers return their no-display message when forced headless. A normal launch could not connect to X11; no virtual display is available. Windows, resizing, physical keyboard/clicks and live dialogs were not checked in this preparation.
References: [1 YD], [2 YS], [3 IF], [4 IP], [5 CP]. Links and brief excerpts: page 5. **Key validated facts:** Identify a specific user task [YD]; compare alternatives and label assumptions [IF].
LIPLET | MONDAY: After Activity 1 on page 1, answer the MONDAY strip (bottom of page 7) in pen. Detach only today's strip.

TUESDAY | Use SWOT to Make Practical Decisions

Goals: Classify specific SWOT entries and explain how the project boundary affects classification. **Value:** Accept a fair challenge to a claim and acknowledge a limitation honestly. **Produce:** Complete an own-theme SWOT with a basis and practical action for each entry.

Definition | SWOT analysis. A check of strengths, weaknesses, opportunities and threats against one objective. Strengths and weaknesses are internal to the project or team; opportunities and threats come from outside that boundary [CAR].

ANALOGY A materials-desk team can improve its own request form. It cannot guarantee that the school will keep a computer available all afternoon. Name who controls the condition before classifying it.

Set the boundary first. For this example, the project is a learner-built, single-computer request-draft tool. The learner controls its code and instructions; school access arrangements and power supply are outside the project. The objective is to prepare a complete draft, not to manage a whole office. The outside conditions below are hypothetical assumptions.

Type / specific entry	Basis / classification	Practical decision
Strength: existing preview checks required choices.	Internal code capability in final RequestDemo; inspect summary().	Reuse the checks instead of redesigning them.
Weakness: drafts disappear when the program closes.	Internal limitation; final RequestDemo has no save/load feature.	Disclose the limit; consider one local save/load improvement.
Opportunity: the school may offer a supervised desk trial.	External possibility, not confirmed permission.	Ask for approval later; use only a classroom simulation now.
Threat: a shared-computer booking may be cancelled.	External access condition, assumed for this scenario.	Keep a labelled paper form as a fallback.

Do more than fill four boxes. Link a strength to an opportunity: reuse validation during a possible supervised trial. Reduce a weakness against a threat: a save/load option may protect a draft between sessions, but it cannot replace access to a computer. Keep paper available. These decisions depend on a later feasibility check [CAR] [ID].

Context matters. "No internet" is a fixed external classroom condition here. It threatens an online-only design, but is not a useful threat entry for a fully offline tool unless you explain its effect. "Our program cannot work offline" is an internal weakness. "Good design" and "many users" are too vague. Replace them with a capability or condition and its basis.

Activity 2 | Own-theme SWOT. State your objective and project boundary. Write at least one specific S, W, O and T for your proposed improvement. For each, give evidence or an assumption label, explain its classification and write one action. Add two linked decisions using pairs of entries. Ask a partner to challenge one classification; revise it or explain why it still fits. Record this as classroom feedback.

Check yourself: if you write "available laptop", explain whether it is owned/controlled by your team (possible strength) or only a possible school loan (possible opportunity). A classification needs a stated boundary, not just a positive or negative word.

Plan your own SWOT decisions

Entry / basis	Why internal or external?	Useful action
S: _____ _____ _____	_____ _____ _____	_____ _____ _____
W: _____ _____ _____	_____ _____ _____	_____ _____ _____
O: _____ _____ _____	_____ _____ _____	_____ _____ _____
T: _____ _____ _____	_____ _____ _____	_____ _____ _____

My two linked decisions: Use S with O: _____
Reduce W against T: _____

References: [1 CAR], [2 ID], [3 YS], [4 IF], [5 YD]. Links and brief excerpts: page 5. **Key validated facts:** Strengths and weaknesses are internal; opportunities and threats are external. Use the entries to choose actions [CAR].

LIPLET | TUESDAY: After Activity 2 on page 2, answer the TUESDAY strip (middle of page 7) in pen. Detach only today’s strip.

WEDNESDAY | Check Whether the System Is Feasible

Goals: Explain technical, operational, economic and schedule feasibility and justify a decision. **Value:** Value realistic commitments, support for users and honest estimates. **Produce:** Complete four feasibility checks, calculate costs and make a timed work plan.

Definition | Feasibility study. A reasoned check of whether a proposed solution is practical with available resources. Check all four areas below before recommending proceed, revise or postpone [TO] [IF].

ANALOGY A desk plan needs more than a working form: someone must use it, help when it fails and have time to maintain it.

Check	Worked example / question still open
Technical: can we build and support it?	Existing Java 8 Swing draft and Week 15 file-handling skills support a small local save/load option. JDK and one computer suffice. File validation and safe failure handling still need design and testing.
Operational: could people use and maintain it?	Plan a 30-minute orientation, clear labels and a paper fallback. Learner maintains source; a future desk helper would operate it. Helper availability and permission are assumptions, not commitments.
Economic: are benefits worth resources used?	Compare a labelled paper form with the software improvement. Count supplies, training and maintenance time; existing equipment is not cost-free to operate. Benefit is clearer reusable drafts, not proven money savings.
Schedule: can the work fit available time?	A hypothetical later 8-hour work allowance supports only a small extension. Allocate 1 h design + 3 h save/load + 2 h testing + 0.5 h orientation + 0.5 h notes + 1 h buffer = 8 h. This is not this week's lesson timetable.

Classroom estimates only, not researched prices. Assume an already available computer and JDK, no new purchase, and shared power covered by the school. That does not prove a real budget. For a one-week trial, assume the following sample supply amounts. Before real use, verify actual prices, equipment access and support.

Resource / assumed basis	One-time	Recurring per trial week
Orientation card: 2 sheets x P2	P4	P0
Fallback forms: 5 sheets x P2	P0	P10
Added hardware/software purchase: none in scenario	P0	P0
Identified supply subtotal	P4	P10

Recalculate: first trial week = P4 + P10 = **P14** identified cash outlay. Four trial weeks = P4 + (4 x P10) = **P44**. These are partial supply totals, not total ownership cost. Developer time is included in the 8-hour plan, not priced as a wage. Operator time is estimated separately at 10 minutes per trial day: 5 days x 10 = 50 minutes/week. Power and future repairs are unpriced shared costs, not zero-cost findings.

Benefit estimate: assume 10 drafts/week and 1 minute less clarification per draft: 10 x 1 = 10 minutes/week, not observed savings or earnings. This does not by itself justify 50 minutes of operation time. Compare the paper form in a later controlled trial before claiming a net benefit.

Decision: revise to a small local draft extension and keep paper fallback; verify access, need and support before a real trial. Proceed only when essential resources and checks are credible. Postpone if a required computer or support is unavailable and no workable smaller scope remains.

Activity 3 | Own-theme feasibility. Complete four checks with available/missing resources, evidence or assumptions, a risk and an action. Separate one-time and recurring costs, state a time period, and show arithmetic. If no new cash purchase is needed, explain time and shared resources. Total a realistic work plan with testing and buffer. Choose proceed, revise or postpone and defend it.

Activity 3 planning record

Area	Available / missing; basis	Risk / action
Technical	_____ _____	_____ _____
Operational	_____ _____	_____ _____
Economic	_____ _____	_____ _____
Schedule	_____ _____	_____ _____

My work allowance: ____ hours. Design ____ + changes ____ + tests ____ + training ____ + notes ____ + buffer ____ = ____ hours.
My decision: _____ because _____

References: [1 TO], [2 IF], [3 YS], [4 CP], [5 IP]. Links and brief excerpts: page 5. **Key validated facts:** A feasible plan considers technology, users, costs and time [TO]; examine estimates and their assumptions [IF].
LIPLET | WEDNESDAY: After Activity 3 on page 3, answer the WEDNESDAY strip (top of page 7) in pen. Detach only today’s strip.

THURSDAY | Write a Short System Proposal

Goals: Explain how needs, requirements, SWOT, resources and feasibility support one proposal. **Value:** Keep claims modest and protect the time and information of intended users. **Produce:** Draft a short proposal for an improvement to your existing own-theme program.

Definition | System proposal. A short plan explaining a useful problem, the intended improvement, the supporting basis, resources and a justified next decision. A requirement states what the system must do; scope sets the limits of the work [CP] [YS].

ANALOGY A proposal is the desk team's clear request to try a small change: what it helps, what it needs and what remains uncertain.

How the pieces fit. Market analysis identifies the task and alternatives. SWOT exposes useful capabilities and risks. Feasibility checks whether the proposed work is realistic. The proposal combines these findings; a promising idea may still need revision before any implementation [IP].

Need / basis	Limited requirement	How to check later
Clear request draft; scenario missing fields.	R1: retain subject, materials and place validation and Preview.	Missing input is rejected; correction produces a full summary.
Resume a draft; assumption A2, not verified demand.	R2: save/load one local draft using a learner-controlled file; no personal data.	Reload a sample; handle missing/malformed files without losing current valid choices.
Recover safely; existing Week 19 behavior.	R3: retain safe Rename and confirmed Clear; warn before replacing an unsaved draft.	Cancel/No/close preserves current data; replacement requires explicit Yes.

Short proposal example | Hypothetical school-materials draft. Intended users are a learner preparing a draft and a desk helper reading it. The classroom scenario describes incomplete loose-paper requests; this is not a finding about our school. A labelled paper form is a serious alternative because it needs no powered computer. The existing RequestDemo already previews subject, materials and place. Whether resuming a draft is useful is assumption A2; a later approved trial must check that task.

Proposed improvement and limits. Add one local save/load draft option to the existing practice program while keeping R1 and R3. Use invented sample requests and an arbitrary request label, never a classmate's personal data. No online submission, stock promise, database or multiple simultaneous users is included. The current program does not yet save or load files.

Analysis and resources. Reusable validation is a strength; no saved draft is a weakness. A possible supervised trial is an external opportunity; cancelled shared-computer access is an external threat. Reuse the controls, limit storage to one file and keep paper fallback. Java/Swing and prior file work make the idea plausible, but safe file handling remains unbuilt. Users would need orientation and a maintainer; neither school adoption nor helper support is confirmed.

Cost, time and recommendation. Use the page 3 assumptions: P4 one-time supplies, P10/week recurring supplies, P14 first week, plus unpriced shared costs and 50 minutes/week operator time. Plan 8 hours of later development and preparation, including testing and buffer. Benefits remain unverified. **Revise** to this small scope and verify A1/A2, access and support before an approved trial. If safe file handling exceeds the allowance, retain the current draft program and reassess. This example is a proposal, not a completed system.

Activity 4 | Begin your own proposal. Use your existing own-theme program, not Vehicle or a renamed copy of RequestDemo. Link three useful requirements to user needs and a later check. Reuse Activities 1–3; resolve contradictions. Use the starter and planning space on pages 5–6. No new Java program is required.

Check yourself: a proposed capability must be labelled planned. Compiling an existing program cannot prove demand, adoption, usability or the success of an unbuilt feature.

Make the recommendation traceable

Your own proposal	Draft notes
Need → requirement → later check	_____ _____ _____
Largest feasibility concern → action	_____ _____ _____
Decision → reason → verification need	_____ _____ _____

State one useful limit and explain it

My proposal includes _____
It excludes _____ because _____
My existing program already _____
A planned capability still needing construction/testing is _____

Continue Activity 4 with the planning table and common-error guide on page 5, then the starter, checklist and rubric on page 6.

THURSDAY continued | Draft and review

Activity 4 continued | Draft review. Write a short proposal of about 2–3 notebook pages, plus compact tables if needed. Use the same user group, problem and scope in every section. A partner should be able to trace each requirement to a need and see why your decision follows. Record feedback as classroom feedback; revise one weak connection.

Plan before final writing	Your own theme / notes
Existing program / current capability	_____
User + task + specific difficulty	_____
Evidence or assumption / verification	_____
Alternative worth comparing / why	_____
Largest risk / reduced scope or action	_____

Common-error guide | Planning errors, not compiler messages

If you see	What is wrong	Fix
"Everyone needs it"; no basis.	An assumption is presented as a finding.	Name the user/task; label the assumption and verification need.
"Good code" in SWOT.	Entry is vague; no decision follows.	Name a capability/limit, classify it and give an action.
A team skill is an opportunity.	Boundary and control are unclear.	Treat an existing team skill as internal; explain context.
"Free" because the JDK is installed.	Time and shared resources are omitted.	List training, operation, maintenance and unpriced costs.
A large feature list with a tiny schedule.	Scope and available time disagree.	Reduce scope or revise the plan; retain checks and buffer.
Role-play is called a user survey.	Classroom feedback is mislabelled.	Label it role-play; state what real evidence is still missing.

Opened university references

[YD] Yale University. Discovery. Brief excerpt: “real goals”. Identify users and their tasks before choosing features.
[YS] Yale University. Define the Scope. Brief excerpt: “success criteria”. Connect features to needs and keep within resource limits.
[CAR] Carleton College SERC. Analyze Your Course in Context. Brief excerpt: “internal influences”. Separate internal and external factors, then use them in decisions.
[ID] Idaho State University. SWOT Quick Reference. Brief excerpt: “internal resources”. Review assets, limitations and outside conditions with others.

[IP] Iowa State University Extension. Writing a Business Plan. Brief excerpt: “supporting evidence”. Keep the plan honest, consistent and clear.
[CP] Carnegie Mellon University. Proposals. Brief excerpt: “realistic plan”. Explain the need, scope, resources and completion plan.
[TO] University of Toronto. The Feasibility Study. Brief excerpt: “Operational Feasibility”. Check technology, use, costs and benefits, and time.
Daily numbered sets: Monday: 1 YD, 2 YS, 3 IF, 4 IP, 5 CP; Tuesday: 1 CAR, 2 ID, 3 YS, 4 IF, 5 YD; Wednesday: 1 TO, 2 IF, 3 YS, 4 CP, 5 IP; Thursday: 1 IP, 2 CP, 3 YS, 4 TO, 5 CAR; Friday: 1 CP, 2 IP, 3 TO, 4 YD, 5 CAR. All eight sources opened and checked; sources may repeat. University material on larger projects is adapted here to a modest classroom proposal. The worked scenario, figures and timetable are teacher-created examples, not findings from these sources.

Activity 4 review record

Partner feedback (classroom feedback only): _____
Connection I revised: _____
Reason / evidence or assumption: _____
Question still needing verification: _____

References: [1 IP], [2 CP], [3 YS], [4 TO], [5 CAR]. Links and brief excerpts: page 5. **Key validated facts:** A proposal connects a need to a realistic plan [CP]; check its claims and internal consistency [IP].
LIPLET | THURSDAY: After Activity 4 on pages 4–6, answer the THURSDAY strip (bottom of page 8) in pen. Detach only today’s strip.
Teacher preparation note: Curriculum guide, page 7, competency 6: develop business plans for a system proposal; market analysis includes SWOT and feasibility. The course-map link could not be accessed; no contents were inferred. The learner task this week is a short planning proposal, not a complete system.

FRIDAY | Your Own Proposal and Presentation

Goals: Defend a recommendation and explain how a new constraint changes the proposal. **Value:** Answer questions honestly and respond constructively to feedback. **Produce:** Check, revise and present your own proposal with evidence or labelled assumptions.

Definition | Consistency check. A review that asks whether the evidence, requirements, resources, costs, schedule and recommendation tell the same story. Revise a claim or plan when the parts disagree [IP] [CP].

ANALOGY Before opening your own counter, compare the promise on its sign with the supplies, staff and time actually available.

Activity 5 | Check, revise and present your own proposal. Review your Activity 4 draft with the checklist and rubric below. Trace a need to a requirement, a feasibility finding and the recommendation. Recalculate totals. Ask a partner to introduce a new constraint; record the response as classroom feedback. Complete one revision, then present your own work. Submit your proposal, Activities 1–3 notes, self-check and revision record. No implementation or online submission is required.

Worked-example check. The single-computer draft tool has a planned, unbuilt R2. P4 + P10 = P14 first-week supplies; 8 hours is a separate later work estimate. With only 4 hours, use the paper form/current preview or postpone file work, then reassess. Apply this reasoning to your own program.

Own-theme task requirements

☐ Name your existing own-theme program and a current capability.

☐ Define a specific problem, intended users and task.

☐ Compare the manual/current process and another alternative.

☐ Record evidence or labelled assumptions with verification needs.

☐ Give specific S, W, O and T entries, their basis and actions.

☐ Complete technical, operational, economic and schedule checks.

☐ Link three limited requirements to needs and later checks.

☐ Explain resources, costs, time, support and a realistic work plan.

☐ Justify proceed, revise or postpone and state remaining limits.

☐ Present briefly, answer honestly and record one revision.

Proposal starter | Fill the blanks

My existing program is ____; it already ____. My intended users are ____ who need to ____ because ____. Current alternatives are ____. My evidence is ____ / assumption A__ is ____, to verify by ____. My S/W/O/T entries and actions are ____. My three requirements, linked needs and checks are ____. Technical/operational/economic/schedule findings are ____. Resources and support are ____. One-time costs are ____; recurring costs per ____ are ____; unpriced resources are ____. My work plan totals ____ including testing and buffer. I recommend proceed/revise/postpone because ____. Before real use, verify ____. I revised ____ after ____.

Self-check before presenting

Check	Status
Same user, problem and scope throughout?	Yes / Not yet
Claims labelled; assumptions have verification needs?	Yes / Not yet
SWOT and four feasibility checks support the decision?	Yes / Not yet
Three requirements connect to needs and existing code?	Yes / Not yet
Costs, time, support and scope agree?	Yes / Not yet
Limits and one revision explained honestly?	Yes / Not yet

Two three-hour days

Thursday: 10 min recall; 30 min proposal model; 30 min requirements; 20 min review/slip; 30 min own-theme plan; 60 min draft = 180 min.
Friday: 10 min recall; 35 min finish; 25 min consistency check; 20 min revision; 15 min rehearsal; 60 min presentations; 15 min slip/reflection = 180 min.

Five-minute presentation

• 30 s: name your existing theme, user and problem.

• 1 min: compare alternatives; point to evidence or assumptions.

• 1 min: explain a SWOT decision and all four feasibility findings.

• 1 min: show requirements, resource/time plan and recommendation.

• 1 min: answer a question honestly; describe one revision.

• 30 s: state what must be verified before real use.

For a large class, use circles of at most 12: 12 x 5 min = 60 min. Peer listeners record one reason and one question; the teacher rotates and reviews each proposal and record.

Prepare using your own proposal

1. Which claim in your own proposal is least certain?
2. Why is the manual alternative insufficient or still useful?
3. How does your existing program support one requirement?
4. What would you remove if available work time halved?
5. What evidence would change your recommendation?

Scoring rubric | 50 points

Criterion	Pts	Score
Problem, users, alternatives and program connection	10	___
Evidence, assumptions and verification needs	8	___
Specific SWOT and practical decisions	8	___
Four feasibility areas, resources, costs and work plan	10	___
Useful requirements and justified recommendation	8	___
Clear presentation, honest answers and revision	6	___
TOTAL	50	___

For each criterion: full points = complete, specific and justified; about half = partly developed or weakly linked; zero = absent/unrelated. Award intermediate whole points for quality. Give credit for honest assumptions with verification needs. Slip scores are separate.

References: [1 CP], [2 IP], [3 TO], [4 YD], [5 CAR]. Links and brief excerpts: page 5. **Key validated facts:** Defend a realistic scope and resource plan [CP]; revise unsupported claims [IP].

LIPLET | FRIDAY: After Activity 5 on page 6 and your presentation, answer the FRIDAY strip (top of page 8) in pen. Detach only today's strip.

WEDNESDAY | Check Whether the System Is Feasible

DEC 2 · Answer after Activity 3 on page 3.
Name: _____ Section: _____ Score: ____ / 15

3.1 Define (5 pts): In Activity 3, distinguish technical and operational feasibility. Give one question for each about your own proposal.

3.2 Explain (5 pts): For your Activity 3 plan, show one cost or time calculation, label its assumptions and explain your proceed/revise/postpone decision.

3.3 Connect (5 pts): Connect Activity 3 to an earlier Java week: name a skill your existing program can reuse, a remaining limit, and its effect on your plan.

CUT ON TUESDAY · DETACH THE TUESDAY STRIP BELOW

TUESDAY | Use SWOT to Make Practical Decisions

DEC 1 · Answer after Activity 2 on page 2.
Name: _____ Section: _____ Score: ____ / 20

2.1 Define (5 pts): In Activity 2, define S, W, O and T and explain the internal/external boundary.

2.2 Explain (5 pts): Defend one classification in your own Activity 2 SWOT. State its basis or assumption and a practical action.

2.3 Identify (5 pts): For the stated learner-team boundary, fill S/W/O/T: (a) existing validation ___; (b) no save/load ___; (c) possible supervised school trial ___; (d) cancelled shared-computer booking ___.

2.4 Connect (5 pts): Connect your Activity 2 SWOT to your existing program: explain two linked entries and a decision to reuse, limit or revise work.

CUT ON MONDAY · DETACH THE MONDAY STRIP BELOW

MONDAY | Find a Useful Problem and Check the Need

NOV 30 · Answer after Activity 1 on page 1.
Name: _____ Section: _____ Score: ____ / 15

1.1 Define (5 pts): In Activity 1, distinguish evidence, an assumption and a proposed feature using your own theme.

1.2 Explain (5 pts): For your Activity 1 problem, compare the current/manual process with one alternative. Why might the simpler option be enough?

1.3 Connect (5 pts): Connect Activity 1 to your own program from Weeks 11–19: name one existing capability and the user need it could support.

FRIDAY | Your Own Proposal and Presentation

DEC 4 · Answer after Activity 5 on page 6 and your presentation.
Name: _____ Section: _____ Score: ____ / 20

5.1 Point (5 pts): In your own proposal and existing program, point to one current capability, its linked requirement, and the evidence or labelled assumption supporting it.

5.2 Evaluate (5 pts): Defend your own proceed/revise/postpone decision using your SWOT and feasibility findings. Name one uncertainty that could change it.

5.3 Apply (5 pts): Your own proposal now has only half its planned work time. Revise its scope or recommendation, work plan and one requirement while preserving a useful task and necessary checks.

5.4 Reflect (5 pts): Compare your own first draft with your final proposal. Explain one revision, the feedback or reasoning behind it, and what still needs verification before real use.

CUT ON THURSDAY · DETACH THE THURSDAY STRIP BELOW

THURSDAY | Write a Short System Proposal

DEC 3 · Answer after Activity 4 on pages 4–6.
Name: _____ Section: _____ Score: ____ / 15

4.1 Define (5 pts): In Activity 4, distinguish a user need, a requirement and scope using your own proposal.

4.2 Explain (5 pts): Trace one own-theme requirement to its need, evidence or assumption, feasibility finding and later check.

4.3 Connect (5 pts): Connect Activity 4 to your existing program: what stays, what improvement is planned, and which rule or safe behavior must remain?

Week 20 CodeShare practice additions

Use this appendix with the original module. Original lesson pages and sample listings remain unchanged. Text backups and data remain unchanged in the supporting-files folder.

This week remains a written proposal. No code steps, artificial output checks or automatic completion were added. Keep paper assessment and your own proposal separate from the module project.

Written proposal work

Continue all original research, requirements, design, proposal, presentation and liplet activities. No code step, fabricated console target or automatic grade has been added. Follow the original performance-task checklist and rubric. The added Proposal.txt is a writing placeholder only.
